

Feature Summary Document

1. Overview Page

Features implemented

Interactive Active Signals

Severity-based filtering (Critical, Warning, Info, All).

Filtering allows users to quickly focus on the most urgent issues.

Expandable alerts with suggested actions.

Human review indicators to support governance requirements.

Workstream Navigation

Workstream cards are clickable and route users directly to:

- Service Operations
- Representative Assistant
- Citizen Services
- Research Review
- Administration

Live Dashboard Simulation

Metrics and alert data refresh automatically to simulate a live environment.

The dashboard provides a more realistic operational experience rather than a static interface.

Since there isn't a real backend yet, the dashboard simulates live data.

Every few seconds:

- Alert ages update
- Charts change slightly
- Metrics fluctuate

Time Range Selection

Users can switch between:

- Last Hour (1H)
- Last 24 Hours (24H)
- Last 7 Days (7D)

The displayed metrics change depending on the selected time period.

Cloud Capability Cards

Added expandable capability cards displaying use cases and implementation details.

System Health Monitoring

Displays statuses for:

Web Layer

Mock API

AI Services

Database Layer

Human Oversight

AI Recommendation Feed

Recommendations are presented as suggestions rather than decisions.

Confidence levels and human approval requirements are emphasized to remain aligned with responsible AI principles.

Workspace Functionality

Panels support:

2. Service Operations Page

An AI-powered operations dashboard helping government teams monitor service performance, manage incidents, and track operational activities in real time.

Features Implemented

Dashboard Metrics

- Active Services
- Open Incidents
- System Availability

Service Operations Queue

- Lists all government services being monitored
- Search and filter to locate services quickly
- Selecting a service loads detailed operational information

Service Workspace

- Displays service name, operational status, health, performance information, and current updates

Service Actions

- Restart a service
- Escalate an issue
- Schedule maintenance
- Update service status

AI Health Monitoring

- AI-generated health analysis identifying potential risks and monitoring system performance

Incident Management

- Visibility into active incidents including status and resolution progress

Activity Timeline

- Chronological view of operational events, system actions, and service updates

AI Activity Feed

- Simulated AI monitoring including health analysis, performance monitoring, incident detection, and operational recommendations

AI Operations Assistant

- Conversational assistant providing information on service status, health, performance issues, and recommended actions

3. Representative Assistant Page

It's a dashboard for a government service representative to assist citizens during live consultations — with built-in AI help, translation, and reference tools all in one screen.

Features implemented

Chat workspace

- representative can ask questions and get AI-generated answers drawn from official policy documents

Quick-action buttons

- inject pre-written prompts into the chat (e.g. "Verify Identity" or "Escalate to Supervisor")

Notes area

- Feature that can be used by the user to jot down internal session notes

Sources panel

- shows which official documents back up the AI's answers

Translation panel

- can listen to a citizen speaking in Arabic, Russian, or Amharic and produce an English and Hebrew translation

Live signals panel

- showing real-time sentiment and alerts from different channels (phone, digital, social)

Real voice recording feature

- The rep can click a microphone button, speak or let the citizen speak, and the audio gets sent to a backend service that transcribes it and translates it into Hebrew automatically. The result appears on screen in real time.

4. Citizen Services Page

An AI-assisted government case management dashboard that helps officers manage citizen service requests from a single workspace.

Features Implemented

Dashboard Metrics

- Active Cases
- Pending Reviews
- Completed Today

Citizen Request Queue

- Lists all available citizen service requests
- Search and filter by case ID, service type, or status
- Selecting a case updates the workspace with its details

Create New Case

- Officers can create a new request via a modal form
- New cases are added dynamically to the queue
- Each case is automatically assigned a unique ID

Selected Case Workspace

- Displays citizen information, service type, processing status, progress indicator, and current requirements
- Officers can approve, request additional documents, or escalate a case

AI Risk Assessment

- Mock AI-generated risk score per case indicating likelihood of processing issues

AI Data Extraction

- Displays information extracted from submitted documents including name, identification, and address

Identity Verification

- Shows progress of photo matching, address verification, and signature review

Officer Notes

- Officers can record internal notes stored separately per case

Self-Service Timeline

- Shows the citizen's journey through completed and current processing steps

AI Activity Feed

- Simulated AI events including OCR extraction, document classification, and fraud checks

AI Assistant

- Conversational assistant answering questions about case status, risk, and processing recommendations

5. Research Review Page

A full-stack Research Proposal Review page integrated into the AI Government Mock Repo, fulfilling RFI 7632. It connects a React/TypeScript frontend to a Node.js/Express/Prisma backend running on localhost:4000.

The proposal pipeline

Proposals move through four stages in sequence:

- Submitted → marked by the committee as Eligible → scored by AI review → committee sets a Decision (Fund / Waitlist / Decline) → Notified

Key features built

Submission form

- collects title, principal investigator, category, abstract, and requested amount, with a dropdown for research categories and validation on required fields

AI scoring

- calls the Claude API via the backend, scoring each proposal 0–10 across significance, feasibility, methodology, and budget fit

Ranked shortlist

- proposals are automatically sorted highest AI score first

Stats bar

- shows total proposals, awaiting screening, AI reviewed count, and average score at a glance

Committee decision buttons

- Fund, Waitlist, and Decline actions only appear after AI review, preserving oversight
- **Notify all** — bulk notifies all reviewed proposals in one click

Design

- Fully themed to match the existing dark app using the app's own CSS variables and class names
- Loading skeletons while data fetches, clear empty states, and inline error messages with

dismiss

Hebrew / RTL support

- Every piece of text is bilingual using the app's existing `lt()` and `useI18n()` system
- The entire page flips to RTL layout automatically when the user switches to Hebrew, including form fields, buttons, status pills, and criteria tags

6.Administration Page

The Administration Page provides a centralized interface for monitoring the operational status of the AI Government platform. It presents key system metrics, platform connectors, governance signals, and audit events in a single interactive view.

Features Implemented

Interactive Dashboard Metrics

- Displays summary cards showing important platform metrics.
- Metrics update dynamically based on connector status and audit event filtering.
- Each metric can be selected to view additional information.

Platform Connector Monitoring

- Displays all available platform connectors with their current operational status.
- Supports simulation of connector failures and recovery without modifying the original data.
- Connector status is displayed using visual status indicators.

Theme Controls

- Includes a theme switcher that allows users to change the application's visual theme.
- Demonstrates support for accessibility and multiple UI themes.

Search Functionality

- Provides a search bar for quickly locating governance signals.
- Filters results based on the entered keyword.

Detail Inspection Panel

- Clicking any metric, connector, audit event, or governance signal opens a side panel

displaying additional information.

- Allows administrators to inspect system information without leaving the dashboard.
